Deep Freezer

As a standalone appliance that supplements a refrigerator freezer in your kitchen, a deep freezer keeps food frozen around 0°F, or -18°C. The name has less to do with temperature and more to do with space. Both chest freezers and upright freezers keep food at 0°F, but you can adjust the settings based on your preferences. You can also adjust temperature settings on a deep freezer based on your preferences and needs. The name "deep freezer" can be used interchangeably with upright freezer and chest freezer, and all designations keep food frozen that won't be eaten or cooked right away.
